

AMENDMENTS TO THE CLAIMS

1. (Currently Amended) A system for information management,
~~which system comprises~~ comprising:

a central unit [[4]]; and

a plurality of user units [[2]] which are arranged to record
and send information to the central unit [[4]], ~~characterized in~~
~~that~~ wherein particulars are stored in the central unit [[4]]
about a plurality of regions ~~(101-105)~~, each of which represents an
area on at least one imaginary surface [[5]],

each of the user units [[2]] is arranged to record
information which comprises at least one position on the imaginary
surface [[5]] and to send the information to the central unit
[[4]], and

the central unit [[4]] is arranged, in response to
the receipt of the information from a user unit [[2]], to
identify to which region ~~(101-105)~~ said at least one position
belongs and to determine how the information is to be managed based
on the region affiliation.

2. (Currently Amended) A system according to claim 1, in which
for each of said regions ~~(101-105)~~ particulars are stored in the
central unit [[4]] about an owner of the region ~~(101-105)~~.

3. (Currently Amended) A system according to claim 1 ~~[[or 2]]~~, in which rules for each region ~~(101-105)~~ are stored in the central unit ~~[[4]]~~ for how the information which is identified as belonging to the region ~~(101-105)~~ is to be managed.

4. (Currently Amended) A system according to claim 1, ~~2-or-3~~, in which the central unit ~~[[4]]~~ is arranged to forward the information which is received from the user unit ~~[[2]]~~ to a recipient ~~[[6]]~~.

5. (Currently Amended) A system according to claim 4, in which the recipient ~~[[6]]~~ is defined by the region affiliation.

6. (Currently Amended) A system according to claim 4 ~~or-5~~, in which the recipient ~~[[6]]~~ is one of said user units ~~[[2]]~~.

7. (Currently Amended) A system according to claim 4, ~~5-or-6~~, in which the central unit ~~[[4]]~~ is arranged to attach a predetermined data packet for the recipient ~~[[6]]~~, which data packet is determined by the region affiliation.

8. (Currently Amended) A system according to claim 1, ~~2-or-3~~, in which the central unit ~~[[4]]~~ is arranged to store the

information which is received from the user unit ~~[[2]]~~ in a location which is indicated by the region affiliation.

9. (Currently Amended) A system according to claim 1 ~~any one of the preceding claims~~, in which the central unit ~~[[4]]~~ is arranged to process the information which is received from the user unit ~~[[2]]~~ in a way which is defined by the region affiliation.

10. (Currently Amended) A system according to claim 1 ~~any one of the preceding claims~~, in which said at least one position is a plurality of positions which define characters and in which the central unit ~~[[4]]~~ is arranged to convert the received positions to at least one character.

11. (Currently Amended) A system according to claim 1 ~~any one of the preceding claims~~, in which each of the user units ~~[[24]]~~ has a pen point ~~[[17]]~~.

12. (Currently Amended) A system according to claim 1 ~~any one of the preceding claims~~, in which each of the user units ~~[[2]]~~ has a unique user identity and is arranged to include the user identity in the information to the central unit ~~[[4]]~~.

13. (Currently Amended) A system according to claim 1 ~~any one of the preceding claims~~, further comprising a plurality of products ~~[[1]]~~ from which said at least one position is recorded.

14. (Currently Amended) A system according to claim 13, in which a subset ~~[[10]]~~ of a position-coding pattern, which codes a large number of positions on said imaginary surface ~~[[5]]~~ is reproduced on each of said products ~~[[1]]~~, the positions which are recorded by the user units ~~[[2]]~~ being positions on the imaginary surface ~~[[5]]~~ and being recorded by means of the subset ~~[[10]]~~ of the position-coding pattern on the product ~~[[1]]~~.

15. (Currently Amended) A system according to claim 14, in which the position-coding pattern is constructed of symbols and each position on said imaginary surface ~~[[5]]~~ is coded by a predetermined number of symbols, and in which each user unit ~~[[2]]~~ is arranged to continually record the symbols to provide a description of the movement in the form of coordinates when it is moved across said subset ~~[[10]]~~ in order to generate the information.

16. (Currently Amended) A system according to claim 1 ~~any one of the preceding claims~~, in which each user unit ~~[[2]]~~ is

arranged to record said information by recording at least two coordinates in coded form for each position, to decode the coded coordinates and to include at least certain of the coordinates in the information to the central unit ~~[[4]]~~.

17. (Currently Amended) A system for information management, ~~which system comprises~~ comprising:

a central unit ~~[[4]]~~ and a plurality of user units ~~[[2]]~~ which are arranged to record and send information to the central unit ~~[[4]]~~; and ~~characterized in that~~

~~the system further comprises~~ a plurality of products ~~[[1]]~~ each of which has a subset ~~[[10]]~~ of a position-coding pattern, which codes a large number of positions on at least one imaginary surface ~~[[5]]~~, wherein

particulars are stored in the central unit ~~[[4]]~~ about a plurality of regions ~~(101-105)~~, each of which represents an area on said imaginary surface ~~[[5]]~~, wherein

each of the user units ~~[[2]]~~ is arranged to record information which comprises at least one position on the imaginary surface ~~[[5]]~~ by means of the subset ~~[[10]]~~ of the position-coding pattern on said product ~~[[1]]~~, and to send the information to the central unit ~~[[4]]~~, and wherein

the central unit ~~[[4]]~~ is arranged, in response to the receipt of the information from a user unit ~~[[2]]~~, to identify to which region ~~(101-105)~~ said at least one position belongs and to determine how the information is to be managed based on the region affiliation.

18. (Currently Amended) A central unit, ~~which is arranged to be incorporated in a system for information management, characterized in that~~ comprising:

~~it comprises~~ a memory ~~[[4']]~~ ~~in which are stored~~ storing particulars about a plurality of regions ~~(101-105)~~, each ~~of which corresponds~~ region corresponding to an area on an imaginary surface ~~[[5]]~~, and containing instructions for

determining ~~it is arranged~~, in response to the receipt of information which contains at least one position on the imaginary surface ~~[[5]]~~, ~~to determine~~ to which region ~~(101-105)~~ said at least one position belongs, and ~~to determine~~ determining how the information is to be managed based on the region affiliation.

19. (Currently Amended) A central unit according to claim 18, which for each of said regions ~~(101-105)~~ stores particulars about an owner of the region ~~(101-105)~~.

20. (Currently Amended) A central unit according to claim 18 ~~or 19~~, which for each of said regions ~~(101-105)~~ stores rules for how information which is identified as belonging to the region ~~(101-105)~~ is to be managed.

21. (Currently Amended) A central unit according to claim 18, ~~19 or 20~~, which is arranged to forward the information to a recipient ~~[[6]]~~.

22. (Currently Amended) A central unit according to claim 18 ~~any one of claims 18-21~~, which is arranged to attach a predetermined file with the information for the recipient ~~[[6]]~~, which file is determined by the region affiliation.

23. (Currently Amended) A central unit according to claim 18 ~~any one of claims 18-22~~, which is arranged to store the information in a location which is indicated by the region affiliation.

24. (Currently Amended) A central unit according to claim 18 ~~any one of claims 18-23~~, which is arranged to process the information in a way which is defined by the region affiliation.

25. (Original) A central unit according to claim 24, which is arranged to convert the received positions into at least one character.

26. (Currently Amended) A method for management of information which is recorded ~~by means of~~ using at least one user unit ~~[[2]]~~, ~~characterized in that~~ comprising:

~~the user unit (2) records the~~ recording information by each
user unit which includes in such a way that this comprises at least
one position on at least one imaginary surface; ~~and the user unit~~
~~(2) sends~~

receiving said information to at a central unit, wherein the
central unit contains particulars about a plurality of regions,
further wherein each region represents an area on the at least one
imaginary surface; (4), and

~~the central unit (4) which contains particulars about a~~
~~plurality of regions (101-105) each of which represents an area on~~
~~at least one imaginary surface (5);~~

identifying, in response to the receipt of the information
from the user unit ~~[[2]]~~, ~~identifies to~~ which region ~~(101-105)~~
said at least one position belongs; and ~~determines~~

determining how the information is to be managed to manage the
information based on the region affiliation.

27. (Currently Amended) A method according to claim 26, in which for each region ~~of the regions (101-105)~~ particulars are stored in the central unit `[[4]]` about the owner of the region ~~(101-105)~~.

28. (Currently Amended) A method according to claim 26 ~~or 27~~, in which for each region ~~(101-105)~~ rules are stored in the central unit `[[4]]` for how the information which is identified as belonging to the region ~~(101-105)~~ is to be managed.

29. (Currently Amended) A method according to claim 26, ~~27 or 28~~, in which the central unit `[[4]]` forwards the information which is received from the user unit `[[2]]` to a recipient `[[6]]`.

30. (Currently Amended) A method according to claim 29, in which the recipient `[[6]]` is defined by the region affiliation.

31. (Currently Amended) A method according to claim 29 ~~or 30~~, in which the central unit `[[4]]` sends the information which is received from the user unit `[[2]]` back to the user unit `[[2]]`.

32. (Currently Amended) A method according to claim 29, ~~30 or 31~~, in which the central unit ~~[[4]]~~ attaches a predetermined data packet for the recipient ~~[[6]]~~, which data packet is determined by the region affiliation.

33. (Currently Amended) A method according to claim 26, ~~27 or 28~~, in which the central unit ~~[[4]]~~ stores the information which is received from the user unit ~~[[2]]~~ in a location which is indicated by the region affiliation.

34. (Currently Amended) A method according to claim 26 ~~any one of claims 26-33~~, in which the central unit ~~[[4]]~~ processes the information which is received from the user unit ~~[[2]]~~ in a way which is defined by the region affiliation.

35. (Currently Amended) A method according to claim 26 ~~any one of claims 26-34~~, in which said at least one position is a plurality of positions which define characters, the central unit ~~[[4]]~~ converting the received positions to at least one character.

36. (Currently Amended) A method according to claim 26 ~~any one of claims 26-35~~, in which each user unit ~~[[2]]~~ has a unique user

identity and includes the user identity in the information which is sent to the central unit ~~[[4]]~~.

37. (Currently Amended) A method according to claim 26 ~~any one of claims 26-36~~, in which said at least one position is recorded on a product ~~[[1]]~~.

38. (Currently Amended) A method according to claim 26 ~~any one of claims 26-37~~, in which each of the user units ~~[[2]]~~ has a pen point ~~[[17]]~~ which makes a mark on the product ~~[[1]]~~ during the recording of said at least one position.

39. (Currently Amended) A method according to claim 37 ~~or 38~~, in which the product ~~[[1]]~~ has a subset ~~[[10]]~~ of a position-coding pattern which codes a large number of positions on said imaginary surface ~~[[5]]~~, the positions which are recorded by the user units ~~[[2]]~~ being positions on the imaginary surface ~~[[5]]~~ and being recorded by means of the subset ~~[[10]]~~ of the position-coding pattern on the product ~~[[1]]~~.

40. (Currently Amended) A method according to claim 39, in which the position-coding pattern is constructed of symbols and each position on said imaginary surface ~~[[5]]~~ is coded by

a predetermined number of symbols, each user unit $[(2)]$, when it is moved across said subset $[(10)]$ to generate the information, continually recording the symbols to provide a description of the movement in the form of coordinates.

41. (Currently Amended) A method according to claim 26 ~~any one of claims 24-40~~, in which the user unit $[(2)]$ records said information by recording for each position at least two coordinates in coded form, by decoding the coded coordinates and by including at least certain of the coordinates in the information to the central unit $[(4)]$.

42. (Original) A storage medium for digital information which is readable by a computer system, in which the storage medium contains a computer program which comprises instructions for causing a processor (4") to determine, in response to the receipt of information which contains at least one position on an imaginary surface (5), to which region (101-105) on the imaginary surface (5) said at least one position belongs, and to determine how the information is to be managed based on the region affiliation.

43-44. (Cancelled)

45. (New) A method for managing information based upon position associated with a machine-readable code, comprising:

 recording information using at least one user unit, wherein the information includes at least one position on a two-dimensional coordinate reference, further wherein the two-dimensional coordinate reference represents physical positions in a unique and continuous manner, and represents a physical area which is larger than any single practicable usable surface;

 sending the information to a central unit, wherein the central unit contains particulars about a plurality of regions, and further wherein each region represents an area on the two-dimensional coordinate reference;

 identifying which region the at least one position belongs in response to the receipt of the information; and

 managing the information based upon rules associated with the identified region, wherein different regions are associated with different rules.

46. (New) The method according to claim 45, wherein the machine-readable code comprises a plurality of symbols, each symbol contributing to the coding of at least two unique positions on the two-dimensional coordinate reference.

47. (New) The method according to claim 46, wherein each symbol comprises a nominal position and a mark.

48. (New) The method according to claim 47, wherein the mark is displaced from the nominal position.

49. (New) The method according to claim 45, further comprises storing particulars in the central unit which associate an owner with a region.

50. (New) The method according to claim 45, further comprises forwarding information by the central unit to a recipient.

51. (New) The method according to claim 45, further comprising storing the information in the central unit in a location specified by the rules.

52. (New) The method according to claim 45, wherein the information includes a unique user identity associated with the user unit.

53. (New) An apparatus for managing information based upon machine-readable code associated with products which are not colocated, comprising:

at least one user unit configured to record information including at least one position described in a two-dimensional coordinate reference, further wherein the two-dimensional coordinate reference represents physical positions in a unique and continuous manner, and represents a physical area which is larger than any single practicable usable surface; and

a central unit, configured to receive the information from the at least one user unit, which identifies a region on the two-dimensional coordinate reference based upon the at least one position, and manages the information based upon rules associated with the identified region, wherein different regions are associated with different rules.

54. (New) The apparatus according to claim 53, wherein the machine-readable code comprises a plurality of symbols, each symbol contributing to the coding of at least two unique positions on the two-dimensional coordinate reference.

55. (New) The apparatus according to claim 54, wherein each symbol comprises a nominal position and a mark.

56. (New) The apparatus according to claim 55, wherein the mark is displaced from the nominal position.

57. (New) The apparatus according to claim 53, wherein the central unit stores particulars which associate an owner with a region.

58. (New) The apparatus according to claim 53, wherein the central unit forwards information to a recipient.

59. (New) The apparatus according to claim 53, wherein the central unit stores the information in a location specified by the rules.

60. (New) The apparatus according to claim 53, wherein the user unit includes a unique user identifier in the information sent to the central unit.
